

Lean Deployment

Lean Deployment begins with training Lean Practitioners in the organization.

Beyond Z consultants will apply the 8 steps of the Diagnose and Design Phase - Demand Analysis, Product Segmentation, Current State VSM. Capacity Analysis, Inventory Analysis, Supplier Analysis, Future VSM and Implementation Plan

Key value streams will be selected to drive deployments. The duration of the deployment project depends on the facility size, base line performance and business dynamics.

The progress is measured through reviews at specified stage gates in the project. The deployment supports transforming the current state to future state of the respective value streams and thereby obtaining the desired business results. It also helps capability development in the organization
